Consensus quality: 117221 bases at least Q30
Consensus quality: 117221 bases at least Q30
Consensus quality: 120225 bases at least Q30
Estimated insert size: 131000; pulse field gel estimation
Estimated insert size: 120288; sum-of-contigs estimation
Quality coverage: 7.76 in Q20 bases; pulse field gel estimation.

NOTE: This is a 'working draft' sequence. It currently
consists of 13 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary, Caps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
as soon as it is available and the accession number will
be preserved.

                                                                                                                                                                                                                                                                                                                                          Sequences shown in AAV54616 to AAV54621 represent LU105 specific CC polynucleotide sequences. These are used in the method of the invention CC for detecting target LU105 nucleic acid. The method comprises treating a CC sample with at least one LU105 specific nucleic acid, or its complement CC which is at least 50 percent identical with the LU105 specific nucleic acid sequences (AAV54616 to AAV54621) LU105 is a lung disease marker. CC clls transformed with a recombinant expression system that contains CC LU105 specific nucleic acid fragments, are used to express recombinant CC LU105 specific nucleic acid fragments, are used to express recombinant CC LU105 polypeptides which are used to raise antibodies. The antibodies are CC used to detect the LU105 antigen, and correspondingly this antigen is CC used to detect specific antibodies, in usual immunoassays. The LU105 CC polypeptides and nucleic acid sequences are used for diagnosis, staging, CC monitoring, prognosis, prevention, treatment and determination of CC susceptibility to, lung disease, specifically cancer. The LU105 CC polypeptides are also used to screen for specific binding agents, useful therapeutically. LU105 is a marker for lung disease (present at high CC concentration, in altered form or in an unusual body compartment). LU105 CC can be detected in blood, plasma or serum in an inexpensive, non-invasive
                                                                                                                                                                                                          Query Match

AZ298109 to AAZ39242 encode AAY87224 to AAY87357 which represent the CC human signal peptide-containing proteins HSPP-1 to HSPPs have anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, can teacancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, can be used in gene therapy. HSPPs can be used to treat or grevent disorders associated with decreased activity or function of HSPP. Such disorders associated with increased contribution of HSPP. Such disorders, earneries cleration contribution of HSPP. Such disorders, earneries conjective or reproductive or developmental disorders, (e.g. arteriosclerosis, conjective or casthma, crohn's disease, ancirobial or other infections, compestive or discasses, schizophrenia, ovalatory defects, muscular dystrophy). HSPP confection and monitoring), in gene therapy, as antisense, condescit profits and monitoring), in gene therapy, as antisense, condescit profits antibodies (Ab) and to screen for agonists and or server for antiponses, and for chromosomal mapping. HSPP are also used to cantegonists, in competitive drug screens, and for purification of HSPP condescitor, HSPP related diseases (in usual immunoassays), as therapeutic cantegonists, in competitive drug screens, and for purification of HSPP condescitation and server for activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, signal peptide-containing protein, HSPP; diagnosis; cancer; inflammation; cardiovascular disease; anticancer; anti-inflammatory; antimicrobial; nootropic, neuroprotective; cardiovascular; hepatotropic; antimicrobial; gene therapy; cell proliferation; neurological disorder; antiasthmatic; gene therapy; cell proliferation; neurological disorder; reproductive disorder; acevalopmental disorder; arteriosclerosis; cirrhosis; psoriasis; acquired immune deficiency syndrome; anaemia; asthma; Crohn's disease; infection; Alzheimer's disease; schizophrenia; parkinson's disease; Huntington's disease; ovulatory defect; muscular dystrophy; ss.

                                                                                                                                       The present sequence is a lung specific gene (LSG) Lng107 from human clone ID 586271. The LSG has high level of tissue specificity for lungs and is overexpressed in cancerous tissues. The sequence serves as a diagnostic marker for detecting, monitoring, staging and prognosticating lung cancer. The diagnosis involves comparing levels of LSG in samples obtained from patient and normal control.

                                                      CC Sequences shown in AAV54616 to AAV54621 represent LU105 specific CC polynucleotide sequences. These are used in the method of the invention CC for detecting target LU105 nucleic acid. The method comprises treating a sample with at least one LU105 specific nucleic acid, or its complement CC which is at least 50 percent identical with the LU105 specific nucleic acid sequences (AAV54616 to AAV54621). LU105 is a lung disease marker. CC cells transformed with a recombinant expression system that contains CC LU105 specific nucleic acid fragments, are used to express recombinant CC LU105 specific nucleic acid fragments, are used to express recombinant CC LU105 polypeptides which are used to raise antibodies. The antibodies are used to detect specific antibodies, in usual immunosassays. The LU105 CC used to detect specific antibodies, in usual immunosassays. The LU105 CC used to detect specific antibodies, treatment and determination of concentration, prognosis, prevention, treatment and determination of concentration, in altered form or in an unusual body compartment). LU105 can be detected in blood, plasma or serum in an inexpensive, non-invasive cc can be detected in blood, plasma or serum in an inexpensive, non-invasive

11-MAR-1999;
The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other bladders such as neuronal, glial, astrocytal, hypothalamic, glandular,
                                                                                                                                                                                                                                   Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumours, leukaemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (GETH )

                                                                                                                                                         The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by recombinant techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               17-AUG-1998

The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bloactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20-MAR-2000;

```

```
nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-pRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF65194 to to AAF65100 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention. Sequence 570 BP; 129 A; 190 C; 170 G; 81 T; 0 other; sequence 570 BP; 129 A; 190 C; 170 G; 81 T; 0 other; set Local Similarity 100.0%; Pred. No. 7.9e-09; Table Common Common

CC polypeptides are useful in detecting PRO polypeptide. The PRO CC polypeptides are useful in detecting PRO polypeptides in a sample, in CC linking a bloactive molecule to a cell expressing a PRO polypeptide, and CC in modulating at least one biological activity of a cell expressing a PRO polypeptide. PRO1312 stimulates histogical activity of a cell expressing a PRO CC useful for treating cardiac insufficiency disorders. PRO1154 and pRO1186 CC PRO943, PRO828, PRO826, PRO168 or PRO$35, PRO826, PRO919, PRO1126, CC PRO943, PRO828, PRO826, PRO168 or PRO$35, PRO826, PRO919, PRO1126, CC useful for treating conditions or disorders where angiogenesis would be cell expressing a provide and prosecular conditions or disorders where angiogenesis would be constituted for treating conditions or disorders where angiogenesis would be cells and are thus cell growth factor (VEGP) stimulated proliferation of endothelial growth factor (VEGP) stimulated proliferation of endothelial cell growth in the proliferation of cells and is thus useful for inhibiting endothelial cell growth. PRO826, CC RRO1068, PRO1184, PRO1346 and PRO1375 stimulate proliferation of CC mammals which would be beneficial in inhibiting tumour growth. PRO826, CC stimulated T-lymphocytes and are therapeutically useful for enhancing retinal neurons cells (PRO132 is also enhances survival/proliferation of CC disorders of injuries, e.g. retinitis pigmentosum, AMD. PRO819, PRO816, PRO1068 or PRO1132 enhances survival/proliferation of decreased mesangial cell function such as Berger disease or other collistic decreased mesangial cell function such as Berger disease or other collistic are thus useful for treating sports injuries, and arthitis. This sequence represents a novel human PRO protein polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 2; Fig 291; 648pp; English.

                                                                                                                                                                           The invention discloses isolated pro secreted/transmembrane polypeptides CC comprising a sequence without signal peptide and the nucleic acid. CC encoding them. The polypeptides can be used to raise antibodies that CC encoding them. The prolypeptides can be used to raise antibodies that CC molecule to a cell expressing a PRO protein and for modulating at least CC one biological activity of a cell. The PRO polypeptides or polynuclectides are also useful in gene therapy, in chromosome CC polynucleotides are useful as molecular markers, or in generating probes. The PRO polypeptides are useful as molecular markers for protein celectrophoresis, and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful cecombinant cell culture or natural sources. The sequences presented in CC probes detecting the PRO polypucleotides of the invention. The sequence data for this patent is also available in electronic xx commat from USPTO at sequence attall the collection of properties.

The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that encoding them. The polypeptides can be used to raise antibodies that encoding them. The polypeptides can be used to raise antibodies that molecule to a cell expressing a PRO protein and for modulating at least molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a zell. The PRO polypeptides or polypeptides or polypeptides or sell. The pRO polypeptides or tunours in biosensors or bioreactors, for detecting or treating e.g. tunours in biosensors or bioreactors, for detecting or treating e.g. tunours in biosensors or bioreactors, for detecting or treating e.g. goats or mammals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or rabbits as targets for therapeutic intervention in certain cancers rabbits as targets for therapeutic intervention in certain cancers the presence of these cancers. The PRO polypeptides are also useful as presence of these cancers are presented in the properties are also useful as presence of these cancers or for chromosome identification. The PRO genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8-MAY-1998;

                                                                                                                                                                                                                 are useful as hybridisation probes or for screening libraries of hunching genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequences presented in ABX79290-ABX79675 are the genes encoding, the primers amplifying and the probes detecting the PRO polynucleotides of the invertion
                                                                                                                                                      Sequence 570 BP; 129 A; 190

CLASSIFICATION: 800
ATTORNEY/AGENT INFORMATION:
NAME: MONTGOMETY, Ilene N.
REGISTRATION NUMBER: 38,972
REFERENCE/DOCKET NUMBER: 2391.00066
TELEPHONE: (248) 539-5050
INFORMATION FOR SEQ ID NO: 7:
SEQUENCE CHARACTERISTICS:
LENGTH: 35060 base pairs
SEQUENCE CHARACTERISTICS:
LENGTH: 35060 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
TOPOLOGY: linear
MOLECULE TYPE: other nucleic acid
DESCRIPTION: promotor, ACHE gene and ARS gene"
ANTI-SENSE: NO
ORIGINAL SOURCE:
ORGANISM: Homo sapiens
